Dear Colleagues and Friends,

Our spine unit has had a long tradition of implementing minimally invasive surgical procedures into our daily clinical practice, including microsurgical techniques, minimally invasive approaches to the anterior spine, thoracoscopic surgeries and others.

The advantages for patients are multifold and include minimal wound pain, early postoperative mobilization, low perioperative morbidity as well as early resumption of sporting activities and early return to a professional lifestyle.

The endoscopic technique in particular has demonstrated highly satisfactory results and has been established as an additional tool in our routine surgical armamentarium.

One of the primary goals of this intensive hands-on workshop is to deliver the theoretical background, to provide the technical tools as well as tips and tricks which are required in order to master the initial stages of the learning curve of this innovative and minimally invasive surgical technique.

As your host, I will be looking forward very much to welcoming you to the beautiful city of Munich, to spend a fruitful and interactive day in our spine unit and to sharing our personal experiences on the endoscopic interlaminar technique.

Yours,

Prof. Dr. Christoph Siepe
